Original SP-21 speaker

View of backside - no holes

View inside - simple

Speaker - 8Ohm, 2w

Done 8 holes

Done!! It is now acting like an expensive speaker.

The modification for this standard Icom SP-21 speaker which was bought several days ago is very easy to do.. Steps are as follows :

- 1) Remove 14 screws
- 2) Slowly open the cover, factory uses gum for speaker cover
- 3) Remove 5 screws at speaker cover
- 4) Slowly remove the insulating material - inside cover
- 5) Use 1/4mm drill to make 8 holes
- 6) Reinstall all covers

I have to say, now the speaker sounds like an expensive speaker & no more audio like 'Tong Kosong'.. Now the audio comes out more pleasant & nice to hear.. Good luck & all the best..
